

Oxygen Forensic Suite 2014 v.6.5

Release date: 18 September 2014

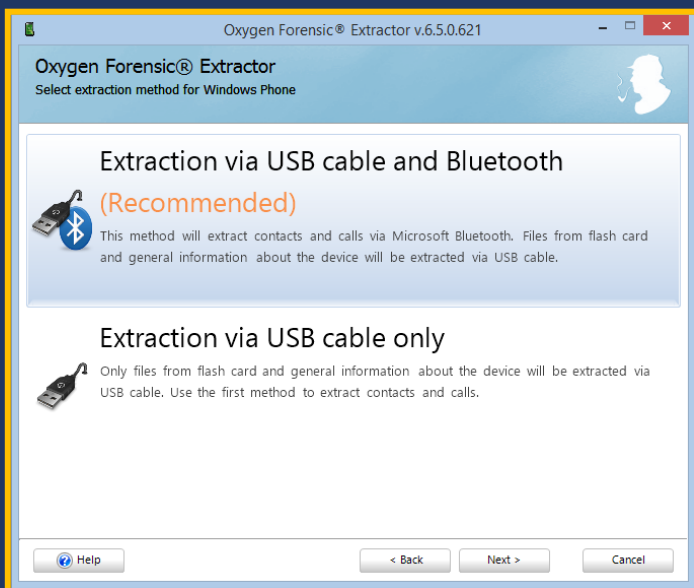

Hot in this version:

- ✓ Data acquisition of Apple iOS 8 devices
- ✓ Advanced extraction from WP devices
- ✓ Exploring private & business connections in applications
- ✓ BlackBerry 10 OS live acquisition
- ✓ Nokia NBU backups support
- ✓ Communications export to XLS
- ✓ Photo thumbnails on the map

Live data extraction from Apple iOS 8.0, BB 10 OS and Windows Phone OS 8.1 devices

8400+
devices

Oxygen Forensic Suite v. 6.5 adds official support for all Apple iOS 8.0, Windows Phone OS 8.1 as well as for BlackBerry 10 OS devices. The total number of supported models is more than 8,400!

Advanced extraction from Windows Phone

The latest release offers extended data extraction from Windows Phone devices. It enables to combine both cable and Bluetooth connection to extract the maximum available evidence.

Implementing breakthrough technologies Oxygen Forensic Suite now can acquire contacts and calls via Bluetooth and read flash card files via cable in one acquisition session. Combining this method with previously added industry-first Windows Live cloud acquisition enables forensic experts to get access to messages thus extracting all basic evidence not supported by any other tool.

To perform advanced extraction forensic experts need to connect Windows Phone device via cable and then continue with Bluetooth connection for calls and contacts acquisition in a single Oxygen Forensic Extractor session.

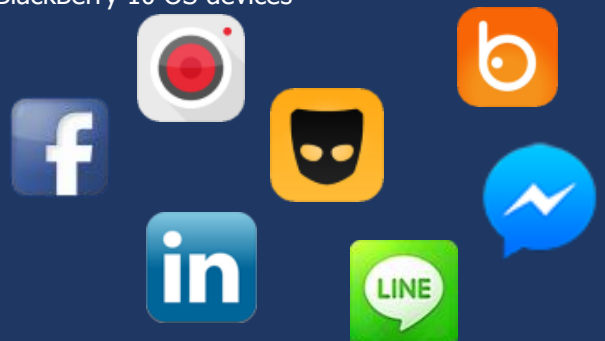

Exploring private and business connections in applications

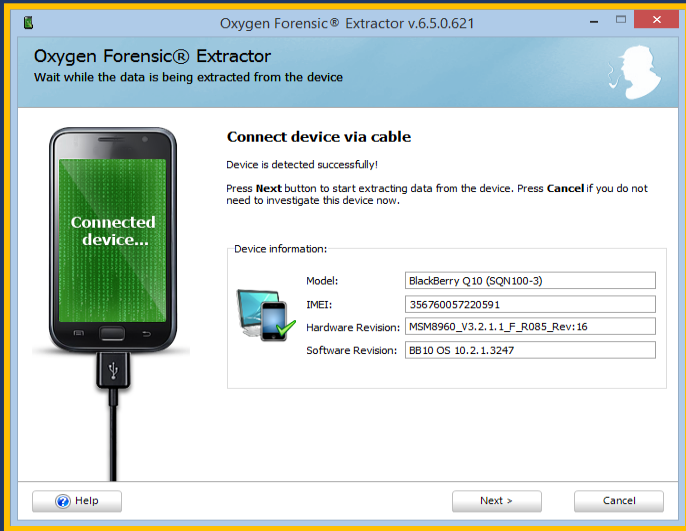

The latest Oxygen Forensic Suite release delivers complete evidence from dating and other social applications enabling to view device owner's private and business connections:

- **Badoo** (3.8.0) for iOS, (2.45.0) for Android OS and (15.729.224.0) for BlackBerry 10 OS devices
- **Grindr** (2.0.17) for iOS and (2.1.1) for Android OS devices
- **Socialcam** (5.11.2) for iOS and (2.5.9) for Android OS devices
- **LinkedIn** (10.5.1) for BlackBerry 10 OS devices

The list of updated apps is as follows:

- **Line** (4.5.1) for iOS devices
- **Facebook Messenger** (10.0.0.17.14) for Android OS devices
- **Facebook** (15.0.0.20.16) for Android OS devices.

BlackBerry 10 OS live acquisition

Oxygen Forensic Suite presents full live data acquisition from the latest BlackBerry 10 OS devices. The new program version smoothly gathers complete digital evidence: contacts, messages, calls, calendar events, files and user data from most popular apps.

Experts can collect accounts, contacts, chats, usage history from BlackBerry Messenger, Default Web Browser, Evernote, Facebook, LinkedIn, Viber, WhatsApp, etc. Deleted data recovery can be easily performed with Oxygen Forensic SQLite Viewer.

Once data is collected investigators can view it in the state-of-the-art interface with rich filtering capabilities and analyze it in Timeline, Aggregated Contacts, Links and Stats and Social Graph.

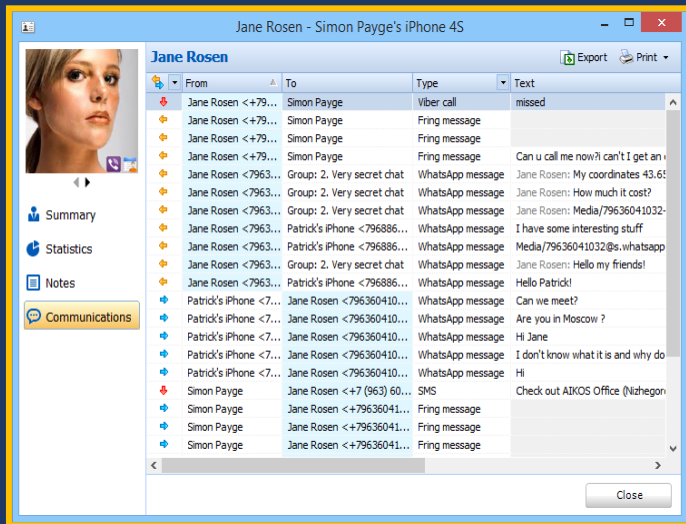

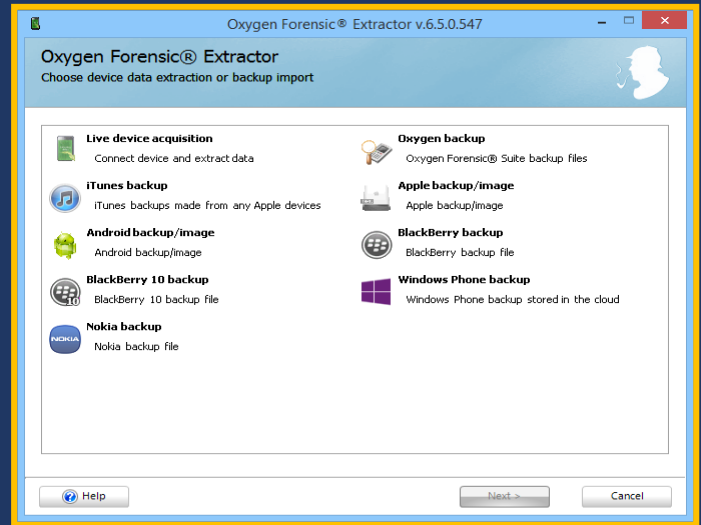

Nokia NBU backups support

Mobile forensics nowadays is not only about analyzing high-end device models but also about low-cost and old phones that many criminals prefer to use in order not to leave much evidence.

We at Oxygen Forensics do not forget about it and implement import and data parsing of Nokia NBU files in the latest release.

NBU backups created in Nokia PC Suite from Nokia Series 40 and Series 60 phones are now parsed with all available data: contacts, messages, calendar, notes, tasks, web browsers data as well as the whole file system.

NBU backup is one more or even the only source of data when the phone itself is damaged or not available at all.

Communications export to XLS

Oxygen Forensic Suite offers a convenient opportunity to view all communications of a particular contact. It is just enough to click on the contact's name on the sidebar in any program section. Communications from all sources (SMS, MMS, E-mails, iMessages, calls, Facetime calls and interactions in apps) are shown with details in a single list.

The latest program version enables to export communications to XLS files in addition to previously added export to PDF. Besides communications a contact card displays general contact info, communications statistics and notes gathered from all sources.

Photo thumbnails on the map

The latest version of Oxygen Forensic Suite allows to view all or selected photos (with geo coordinates) on built-in maps.

Timeline section and Maps and Routes menu allow to select needed photos and time period and then view all photos on built-in maps.

Maps with photos can be exported to several external file formats (.jpg, .png) and printed for further analysis.
